Protection

IsoHold™ attaches to the saliva ejector and allows the operator to suction, retract, and protect. It enables an increased field of view of the oral cavity and prep site, reduces chair time, and decreases aerosol. It also functions as a bite block. A truly unique design, its patented design allows for a multi-functional device.

IsoHold™

Patient Comfort

Patient comfort is built into the design of this unit. It's unique curvature and shape allow the body of the device to retract tissue with ease.

Assistant

IsoHold™ was designed with assistants in mind. Its curvature enables the retraction of tissue and suction at the same time and protects tissue without any interruption to the procedure.

Practitioner

IsoHold's™ design is a unique product that allows the practitioner to have a wider working area while keeping the field dry and protected while working. The practitioner can work continuously without interruption from the assistant. This enhances patient experience, reduces chair time, and decreases load on the practitioner. We have seen an over 30% reduction in chair time when the device was in use.

Applications:

- Restorative procedures
- General dentistry
- Endodontics
- Periodontics
- Bite blocks
- Ultrasonic Scaling
- Root planing
- Prophylaxis
- Debridements
- Sealants
- Orthodontics
